

WHAT IS CLAIMED IS:

1. A method for handover execution in a wireless environment, comprising:

communicating, by a mobile network, a handover  
5 command message to a physical layer of a mobile station  
to initiate a handover execution, the handover command  
message being received by the physical layer and the  
physical layer responding to the handover command message  
by tuning to a handed to frequency and by communicating  
10 physical layer bursts over the handed to frequency to the  
mobile network such that initial timing advance and power  
control setting characteristics are determined by the  
mobile network; and

communicating a cease signal, by the mobile network,  
15 to the mobile station to stop communicating the physical  
layer bursts, the mobile station responding to the cease  
signal by ending the transmission of the physical layer  
bursts and by establishing a new communications link over  
the handed to frequency with the mobile network, wherein  
20 once the new communications link is established the  
mobile station and the mobile network couple to a voice  
path such that a wireless communication associated with  
the mobile station and the mobile network is facilitated.

25 2. The method of Claim 1, wherein communicating  
the handover command message to initiate the handover  
execution to the physical layer comprises communicating  
the handover command message through a radio resource  
management (RRM) layer, a data link layer, and a physical  
30 layer associated with the mobile network.

3. The method of Claim 2, further comprising  
suspending signaling of a non-handover status, by the  
physical layer of the mobile station, in response to the  
handover command message that is communicated by the  
5 mobile network.

4. The method of Claim 1, further comprising  
completing a handover decision associated with the mobile  
station and the mobile network before the handover  
10 command message is communicated by the mobile network.

5. The method of Claim 1, wherein once the new  
communications link is established between the mobile  
station and the mobile network, the mobile station  
15 communicates a signal to the mobile network indicating  
completion of the handover execution.

6. A method for handover execution in a wireless environment, comprising:

receiving, from a mobile network, a handover command message to initiate a handover execution, the handover  
5 command message being received by a physical layer of a mobile station;

tuning, by the physical layer, to a handed to frequency;

communicating, by the physical layer, physical layer  
10 bursts over the handed to frequency to the mobile network such that initial timing advance and power control setting characteristics are determined by the mobile network;

receiving, from the mobile network, a cease signal  
15 indicating to stop communicating the physical layer bursts;

ending, by the physical layer, the transmission of the physical layer bursts; and

establishing a new communications link over the  
20 handed to frequency with the mobile network, wherein once the new communications link is established the mobile station and the mobile network couple to a data path such that a wireless communication associated with the mobile station and the mobile network is facilitated.

25

7. The method of Claim 6, wherein the handover command message to initiate the handover execution is communicated through a radio resource management (RRM) layer, a data link layer, and a physical layer associated  
30 with the mobile network.

8. The method of Claim 7, further comprising suspending signaling of a non-handover status, by the physical layer of the mobile station, in response to the handover command message.

5

9. The method of Claim 6, further comprising completing a handover decision associated with the mobile station and the mobile network before the handover command message is received by the physical layer of the mobile station.

10

10. The method of Claim 6, wherein once the new communications link is established between the mobile station and the mobile network, the mobile station communicates a signal to the mobile network indicating completion of the handover execution.

15

11. Software embodied in a computer readable media for performing handover execution in a wireless environment, the software operable to:

5 communicate a handover command message to a physical layer of a mobile station to initiate a handover execution, the handover command message being received by the physical layer of the mobile station and the physical layer responding to the handover command message by tuning to a handed to frequency and by communicating  
10 physical layer bursts over the handed to frequency to a mobile network such that initial timing advance and power control setting characteristics are determined by the mobile network; and

15 communicate a cease signal to the mobile station to stop communicating the physical layer bursts, the mobile station responding to the cease signal by ending the transmission of the physical layer bursts and by establishing a new communications link over the handed to frequency with the mobile network, wherein once the new  
20 communications link is established the mobile station and the mobile network couple to a data path such that a wireless communication associated with the mobile station and the mobile network is facilitated.

25 12. The software of Claim 11, wherein the software that is operable to communicate the handover command message to initiate the handover execution to the physical layer of the mobile station comprises a radio resource management (RRM) layer, a data link layer, and a  
30 physical layer associated with the mobile network.

13. The software of Claim 12, further operable to suspend signaling of a non-handover status, by the physical layer of the mobile station in response to the handover command message.

5

14. The software of Claim 11, further operable to complete a handover decision associated with the mobile station and the mobile network before the handover command message is communicated by the mobile network..

10

15. The software of Claim 11, wherein the mobile station comprises software operable to communicate a signal to the mobile network indicating completion of the handover execution after the new communications link is established between the mobile station and the mobile network.

15

16. Software embodied in a computer readable media for performing handover execution in a wireless environment, the software operable to:

receive, from a mobile network, a handover command  
5 message to initiate a handover execution, the handover command message being received by a physical layer of a mobile station;

tune to a handed to frequency;

communicate physical layer bursts to the mobile  
10 network over the handed to frequency such that initial timing advance and power control setting characteristics are determined by the mobile network;

receive, from the mobile network, a cease signal  
15 indicating to stop communicating the physical layer bursts;

end the transmission of the physical layer bursts;  
and

establish a new communications link with the mobile  
network, wherein once the new communications link is  
20 established the mobile station and the mobile network couple to a data path such that a wireless communication associated with the mobile station and the mobile network is facilitated.

25 17. The software of Claim 16, wherein the software operable to receive the handover command message to initiate the handover execution is in response to a communication from the mobile network, and wherein the software is further operable to communicate the handover  
30 command message through a radio resource management (RRM) layer, a data link layer, and a physical layer associated with the mobile network.

18. The software of Claim 17, further operable to suspend signaling of a non-handover status in response to the handover command message that is received by the physical layer of the mobile station.

19. The software of Claim 16, further operable to complete a handover decision associated with the mobile station and the mobile network before the handover command message is received by the physical layer of the mobile station.

20. The software of Claim 16, wherein the mobile station comprises software operable to communicate a signal to the mobile network indicating completion of the handover execution after the new communications link is established between the mobile station and the mobile network.

21. A system for handover execution in a wireless environment, comprising:

means for communicating, by a mobile network, a handover command message to a physical layer of a mobile station to initiate a handover execution, the handover command message being received by the physical layer and the physical layer responding to the handover command message by tuning to a handed to frequency and by communicating physical layer bursts over the handed to frequency to the mobile network such that initial timing advance and power control setting characteristics are determined by the mobile network; and

means for communicating a cease signal, by the mobile network, to the mobile station to stop communicating the physical layer bursts, the mobile station responding to the cease signal by ending the transmission of the physical layer bursts and by establishing a new communications link over the handed to frequency with the mobile network, wherein once the new communications link is established the mobile station and the mobile network couple to a voice path such that a wireless communication associated with the mobile station and the mobile network is facilitated.

22. The system of Claim 21, wherein the means for communicating the handover command message to initiate the handover execution to the physical layer comprises means for communicating the handover command message through a radio resource management (RRM) layer, a data link layer, and a physical layer associated with the mobile network.

23. The system of Claim 22, further comprising  
means for suspending signaling of a non-handover status,  
by the physical layer of the mobile station, in response  
to the handover command message that is communicated by  
5 the mobile network.

24. The system of Claim 21, further comprising  
means for completing a handover decision associated with  
the mobile station and the mobile network before the  
10 handover command message is communicated by the mobile  
network.

25. The system of Claim 21, wherein once the new  
communications link is established between the mobile  
15 station and the mobile network, the mobile station  
communicates a signal to the mobile network indicating  
completion of the handover execution.

26. A system for handover execution in a wireless environment, comprising:

means for receiving, from a mobile network, a handover command message to initiate a handover  
5 execution, the handover command message being received by a physical layer of a mobile station;

means for tuning, by the physical layer, to a handed to frequency;

means for communicating, by the physical layer,  
10 physical layer bursts over the handed to frequency to the mobile network such that initial timing advance and power control setting characteristics are determined by the mobile network;

means for receiving, from the mobile network, a  
15 cease signal indicating to stop communicating the physical layer bursts;

means for ending, by the physical layer, the transmission of the physical layer bursts; and

means for establishing a new communications link  
20 over the handed to frequency with the mobile network, wherein once the new communications link is established the mobile station and the mobile network couple to a data path such that a wireless communication associated with the mobile station and the mobile network is  
25 facilitated.

27. The system of Claim 26, wherein the handover command message to initiate the handover execution is communicated through a radio resource management (RRM)  
30 layer, a data link layer, and a physical layer associated with the mobile network.

28. The system of Claim 27, further comprising means for suspending signaling of a non-handover status, by the physical layer of the mobile station, in response to the handover command message.

5

29. The system of Claim 26, further comprising means for completing a handover decision associated with the mobile station and the mobile network before the handover command message is received by the physical  
10 layer of the mobile station.

30. The system of Claim 26, wherein once the new communications link is established between the mobile station and the mobile network, the mobile station  
15 communicates a signal to the mobile network indicating completion of the handover execution.
